

Task One: Linking the pages together

You are now going to learn how to link the three Pizza web pages into a website. This is achieved by using the <a> tag.

Open up the three web pages in notepad ++.

a) We will begin by amending the pizzaHome.html page.

Above the <h1> element insert the following html:

** Link to the Pizza Lists Page **

Save the document and view the webpage. You should now see the hyperlink at the top of the page. It will be blue and underlined.

Click on and test that it will take you to the Pizza Lists webpage.

The attribute href="pizzaLists.html" is how you dictate what page the link will go to. The text you enter in between the tags e.g. Link to the Pizza Lists page, is what the user will see

b) Add another hyperlink to the pizzaHome.html page that will link to the pizzaPics.html page

c) Create links on the pizzaLists.html page that will link to the other two pages

d) Create hyperlinks on the pizzaPics.html page that will link to the other two pages.

If you can successfully navigate between all three pages correctly, Congratulations you have just created your first website.
